Mathematical Induction

In general, mathematical induction * can be used to prove statements that assert that $P(n)$ is true for all positive integers n , where $P(n)$ is a propositional function. A proof by mathematical induction has two parts, a **basis step**, where we show that $P(1)$ is true, and an **inductive step**, where we show that for all positive integers k , if $P(k)$ is true, then $P(k + 1)$ is true.

PRINCIPLE OF MATHEMATICAL INDUCTION To prove that $P(n)$ is true for all positive integers n , where $P(n)$ is a propositional function, we complete two steps:

BASIS STEP: We verify that $P(1)$ is true.

INDUCTIVE STEP: We show that the conditional statement $P(k) \rightarrow P(k + 1)$ is true for all positive integers k .

Exercises

1. Use mathematical induction to Show that

$$1 + 2 + \dots + n = \frac{n(n+1)}{2} , \text{ where } n \text{ is a positive integer : } \forall n \geq 1$$

Solution: Let $P(n)$ be the proposition , $P(n): "1 + 2 + \dots + n = \frac{n(n+1)}{2}"$

BASIS STEP: $P(1)$? when $n = 1$, L H S = 1 , R H S = $\frac{1(1+1)}{2} = 1$

$$\therefore \text{L H S} = \text{R H S} \Rightarrow \therefore P(1) \text{ is true .}$$

INDUCTIVE STEP: Let k is integer where $k \geq 1$ and assume that $p(k)$ is true , \Rightarrow

$$1 + 2 + \dots + k = \frac{k(k+1)}{2} \quad (*)$$

Our goal is to show that $p(k + 1)$ is also true

$$1 + 2 + \dots + k + (k+1) = \frac{(k+1)(k+2)}{2} \quad (\text{Our Goal}) ?$$

From (*) add the term ($k + 1$) (the term # $n = k + 1$) to both sides \Rightarrow

$$\begin{aligned} 1 + 2 + \dots + k + (k+1) &= \frac{k(k+1)}{2} + (k+1) \\ &= \frac{k(k+1)+2(k+1)}{2} \\ &= \frac{k^2+3k+2}{2} \\ &= \frac{(k+1)(k+2)}{2} \end{aligned}$$

So $p(k + 1)$ is true . #

2. Use mathematical induction to Show that

$$\frac{1}{1 \times 3} + \frac{1}{3 \times 5} + \frac{1}{5 \times 7} + \cdots + \frac{1}{(2n-1)(2n+1)} = \frac{n}{2n+1} : \forall n \geq 1$$

Solution:

Let $p(n)$: " $\frac{1}{1 \times 3} + \frac{1}{3 \times 5} + \frac{1}{5 \times 7} + \cdots + \frac{1}{(2n-1)(2n+1)} = \frac{n}{2n+1}$ "

BASIS STEP: $P(1)??$ When $= 1$, LHS = $\frac{1}{(2(1)-1)(2(1)+1)} = \frac{1}{(1)(3)} = \frac{1}{3}$
RHS = $\frac{1}{2(1)+1} = \frac{1}{3}$

$\therefore \text{LHS} = \text{RHS} \Rightarrow P(1)$ is true .

INDUCTIVE STEP: Let k is integer where $k \geq 1$ and assume that $p(k)$ is true , \Rightarrow

$$\frac{1}{1 \times 3} + \frac{1}{3 \times 5} + \frac{1}{5 \times 7} + \cdots + \frac{1}{(2k-1)(2k+1)} = \frac{k}{2k+1} (*)$$

Our goal is to show that $p(k+1)$ is also true

$$\frac{1}{1 \times 3} + \frac{1}{3 \times 5} + \frac{1}{5 \times 7} + \cdots + \frac{1}{(2k-1)(2k+1)} + \frac{1}{(2k+1)(2k+3)} = \frac{k+1}{2k+3} (\text{ Our Goal }) ?$$

add the term $\frac{1}{[2(k+1)-1][2(k+1)+1]}$ (the term # $n = k+1$) to the both sides in $(*) \Rightarrow$

$$\begin{aligned} \frac{1}{1 \times 3} + \frac{1}{3 \times 5} + \frac{1}{5 \times 7} + \cdots + \frac{1}{(2k-1)(2k+1)} + \frac{1}{(2k+1)(2k+3)} &= \frac{k}{2k+1} + \frac{1}{(2k+1)(2k+3)} \\ &= \frac{k(2k+3)+1}{(2k+1)(2k+3)} \\ &= \frac{2k^2+3k+1}{(2k+1)(2k+3)} \\ &= \frac{(2k+1)(k+1)}{(2k+1)(2k+3)} \\ &= \frac{k+1}{2k+3} \end{aligned}$$

So $p(k+1)$ is true . #

3. Use mathematical induction to Show that

$$1 \cdot 2 + 2 \cdot 3 + \dots + n(n+1) = \frac{n(n+1)(n+2)}{3} : \forall n \geq 1$$

Solution: let $P(n)$ $1 \cdot 2 + 2 \cdot 3 + \dots + n(n+1) = \frac{n(n+1)(n+2)}{3}$

B.S.: $P(1)$? When $n=1 \Rightarrow L.H.S = \underbrace{1 \cdot 2}_{1(2)} = 2$

$L.H.S = 2(1+2) = 2 \therefore L.H.S = R.H.S \Rightarrow P(1)$ is true

Induc. Step.: let $K \geq 1$ and assume that $P(k)$ is true. $1 \cdot 2 + 2 \cdot 3 + \dots + k(k+1) = \frac{k(k+1)(k+2)}{3}$

we going to show that $P(k+1)$ is true. $1 \cdot 2 + 2 \cdot 3 + \dots + (k+1)(k+2) = \frac{(k+1)(k+2)(k+3)}{3}$?

$$\begin{aligned} & 1 \cdot 2 + 2 \cdot 3 + \dots + k(k+1) + (k+1)(k+2) \\ &= \frac{k(k+1)(k+2)}{3} + (k+1)(k+2) \end{aligned}$$

$$= \frac{k(k+1)(k+2)}{3} + \frac{3(k+1)(k+2)}{3} = \frac{(k+1)(k+2)(k+3)}{3}$$

$$= \frac{(k+1)(k+2)(k+3)}{3} \Rightarrow \text{So } P(k+1) \text{ is true}$$

$\Rightarrow P(n)$ is true for $n \geq 1$

done #

4. Use mathematical induction to Show that

$$1 \cdot 2 \cdot 3 + 2 \cdot 3 \cdot 4 + \cdots + n(n+1)(n+2) = \frac{n(n+1)(n+2)(n+3)}{4} : \forall n \geq 1$$

Solution:

5. Use mathematical induction to Show that

if n is a positive integer, then $1 + 3 + 5 + \dots + (2n - 1) = n^2$

Solution: Let $P(n)$ be the proposition ,

$$P(n): "1 + 3 + 5 + \dots + (2n - 1) = n^2"$$

BASIS STEP: $P(1)$? when $n = 1 \Rightarrow \text{LHS} = 2(1) - 1 = 1$, $\text{RHS} = 1^2 = 1$

$\therefore \text{LHS} = \text{RHS} \Rightarrow \therefore P(1) \text{ is true.}$

INDUCTIVE STEP: Let k is integer where $k \geq 1$ and assume that $p(k)$ is true ,

$$1 + 3 + 5 + \cdots + (2k - 1) = k^2 \quad (*)$$

Our goal is to show that $p(k + 1)$ is also true

$$1 + 3 + 5 + \cdots + (2k - 1) + (2k + 1) = (k + 1)^2 \quad (\text{Our Goal}) ?$$

add the term $[2(k+1)-1]$ (the term # $n = k+1$) to both sides in (*) \Rightarrow

$$1 + 3 + 5 + \cdots + (2k - 1) + (2k + 1) = k^2 + (2k + 1)$$

(where $P(k)$ is true *) [the term # $n = k+1$]

$$\begin{aligned} &= k^2 + 2k + 1 \\ &= (k + 1)^2 \end{aligned}$$

So $p(k + 1)$ is true. #

6. Use mathematical induction to Show that

$$\frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \cdots + \frac{1}{2^n} = \frac{2^n - 1}{2^n} \quad : \forall n \geq 1$$

Solution: let $P(n)$: $\frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \cdots + \frac{1}{2^n} = \frac{2^n - 1}{2^n}$

BS: $P(1)$? When $n=1 \Rightarrow L.H.S = \frac{1}{2} = R.H.S = \frac{3-1}{2} = \frac{1}{2}$
 $\Rightarrow P(1)$ is true. Induc step: let $k \geq 1$ and

Assume that $P(k)$ is true.

$\frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \cdots + \frac{1}{2^k} = \frac{2^k - 1}{2^k}$ argue to show that $P(k+1)$ is also true.

$$\frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \cdots + \frac{1}{2^k} + \frac{1}{2^{k+1}} = \frac{2^{k+1} - 1}{2^{k+1}}$$

$$\Rightarrow \frac{1}{2} + \frac{1}{2^2} + \frac{1}{2^3} + \cdots + \frac{1}{2^k} + \frac{1}{2^{k+1}} = \frac{2^k - 1}{2^k} + \frac{1}{2^{k+1}}$$

$$= \frac{2^k(2-1)}{2^k} + \frac{1}{2^{k+1}} = \frac{2^{k+1}-1}{2^{k+1}} = \frac{2^{k+1}-1}{2^{k+1}}$$

so $P(k+1)$ is true $\Rightarrow P(n)$ is true
 for $n \geq 1$ done $\#$

7. Use mathematical induction to Show that

$$1 + 2 + 2^2 + \cdots + 2^n = 2^{n+1} - 1$$

for all nonnegative integers n .

Solution: Let $P(n)$ be the proposition ,

$$P(n): "1 + 2 + 2^2 + \dots + 2^n = 2^{n+1} - 1"$$

BASIS STEP: $P(0)$? when $n = 0 \Rightarrow \text{LHS} = 2^0 = \boxed{1}$, $\text{RHS} = 2^{0+1} - 1 = 2 - 1 = \boxed{1}$

$\therefore \text{LHS} = \text{RHS} \Rightarrow \therefore P(0)$ is true.

INDUCTIVE STEP Let k is integer where $k \geq 1$ and assume that $p(k)$ is true ,

$$1 + 2 + 2^2 + \cdots + 2^k = 2^{k+1} - 1 \quad (*)$$

Our goal is to show that $p(k + 1)$ is also true

$$1 + 2 + 2^2 + \dots + 2^n + 2^{n+1} = 2^{n+2} - 1 \quad (\text{Our Goal}) ?$$

add the term $[2^{k+1}]$ (the term # $n = k + 1$) to both sides in (*) \Rightarrow

$$1 + 2 + 2^2 + \cdots + 2^k + (2^{k+1}) = 2^{k+1} - 1 + 2^{k+1}$$

(where $P(k)$ is true *) [the term # $n = k+1$]

$$= 2 \cdot 2^{k+1} - 1$$

$$= 2^{(k+1)+1} - 1$$

$$\equiv 2^{n+2} - 1$$

So $p(k + 1)$ is true. #

8. Use mathematical induction to Show that

$$2 + 2(-7) + 2(-7)^2 + 2(-7)^3 + \cdots + 2(-7)^n = \frac{1 - (-7)^{n+1}}{4} : n \geq 0$$

Solution:

9. Use mathematical induction to Show that

$$1 \times 2 + 2 \times 2^2 + 3 \times 2^3 + \cdots + n \times 2^n = 2 + (n - 1)2^{n+1} : n \geq 1$$

Solution:

10. Use mathematical induction to Show that

$$\sum_{j=0}^n ar^j = a + ar + ar^2 + \cdots + ar^n = \frac{ar^{n+1} - a}{r - 1}$$

where n is a nonnegative integer. , when $r \neq 1$

Solution: Let $P(n)$ be the proposition ,

$P(n)$: “

$$\sum_{j=0}^n ar^j = a + ar + ar^2 + \cdots + ar^n = \frac{ar^{n+1} - a}{r - 1}$$

Where $r \neq 1$,

BASIS STEP: $P(0)$? when $n=0$ L H S = $ar^0 = a \cdot 1 = a$,
 R H S = $\frac{ar^{0+1}-a}{r-1} = \frac{a(r-1)}{r-1} = a$
 $\therefore L H S = R H S \Rightarrow \therefore P(0)$ is true .

INDUCTIVE STEP: Let k is integer where $k \geq 0$ and assume that $p(k)$ is true ,

$$a + ar + ar^2 + \cdots + ar^k = \frac{ar^{k+1} - a}{r - 1} \quad (*)$$

Our goal is to show $p(k + 1)$ is also true

$$a + ar + ar^2 + \cdots + ar^k + ar^{k+1} = \frac{ar^{k+2} - a}{r - 1} \quad (\text{Our Goal})?$$

Add ar^{k+1} to both sides of the equation in $(*)$ we obtain

$$a + ar + ar^2 + \cdots + ar^k + (ar^{k+1}) = \frac{ar^{k+1} - a}{r - 1} + ar^{k+1}$$

(where $P(k)$ is true *) [the term # $n=k+1$]

\Rightarrow

$$\begin{aligned} \frac{ar^{k+1} - a}{r - 1} + ar^{k+1} &= \frac{ar^{k+1} - a}{r - 1} + \frac{ar^{k+2} - ar^{k+1}}{r - 1} \\ &= \frac{ar^{k+2} - a}{r - 1}. \end{aligned}$$

Combining these last two equations gives

$$a + ar + ar^2 + \cdots + ar^k + ar^{k+1} = \frac{ar^{k+2} - a}{r - 1}.$$

So $P(k + 1)$ is true . #

11. Use mathematical induction to Show that

 $\therefore L.H.S=R.H.S \Rightarrow P(1)$ is true. Inductive Step: Let

$K \geq 1$ < (1) Assume that $P(K)$ is true

$1 + 4 + 7 + \dots + (3K - 2) = \frac{K(3K - 1)}{2}$ • Our goal is
 to show that $P(K+1)$ is also true.
 $1 + 4 + 7 + \dots + (3K - 2) = \frac{(K+1)(3K+2)}{2}$

$$\begin{aligned} &\stackrel{(+)}{\Rightarrow} 1 + 4 + 7 + \dots + (3K-1)(3K-2) = \frac{K(3K-1)}{2} + (3K-1) \\ &= \frac{K(3K-1)}{2} + \frac{2(3K-2)}{2} = \frac{3K^2 - K + 6K - 2}{2} \\ &= \frac{3K^2 + 5K + 2}{2} = \frac{(K+1)(3K+2)}{2} \end{aligned}$$
